1. 实现方式

- 遍历works数组，把对应的div item通过document.write直接写入html即可

```
function output(){
  for(var i=0;i<4;i++){
    var line=works[i];
    var str=` <div class='item'>
                <h4>Genre : `+line.tips+`</h4>
                <div class='inner-box'>
                  <h3 style='display:inline'>`+line.author+`</h3>
                  <h5 style='display:inline; margin-
left:1em'>lifetime:`+line.lifetime+`</h5>
                </div>
                <div class='inner-box'>
                  <h3>Popular Photos</h3>`;
    for(var phstr in line.photos){
      str+=     `<img class='photo' src='`+line.photos[phstr]+`'>`;
    }
    str+=       `</div>
                <button>Visit</button>
              </div>`;
    document.write(str);
  }
}
output();
```
